

Dear David:

Thank you for your recent sponsorship of The BioSUB Project (www.biosub.com.au). I believe your Intrinsically Safe Power Talk Box Communication System was put through the ultimate test during my 12 day stay in an underwater habitat. The Power Talk Box (PTB) withstood 100% humidity, condensation and continual harsh use in an extremely rugged environment without a single problem. The batteries lasted for well over 200 hours without needing to be changed. It rarely occurs that companies understate their product's performance like this.

While underwater, I utilised the alarm function on several occasions to alert my crew members on the surface of a problem. This function, along with the capability for hands free two way communication, was vital for both my safety and the success of the project. The ability of my crew members to adjust my powered speaker volume from the surface worked well in making sure my sound quality was maintained at optimum levels depending on the background noise inside the habitat. The cable connecting the two PTB units ran over 30 metres through the water and was therefore exposed to the harshest of conditions throughout the duration of the project.

Based on your products performance, I would have no hesitation endorsing your product for almost any situation thinkable. This was my only means of communicating with my surface support crew and the hundreds of visitors I received to the site each day. The Push To Talk (PTT) switch was simple enough for children to operate, enabling them to communicate with me while underwater giving them a memorable and unique experience. I put my safety in the hands of your portable intercom system and hope that OTB Products would consider sponsoring any further adventures I may undertake.

Thanks again for your generous support and I look forward to putting your products through the ultimate test again soon.

Best regards,

Lloyd Godson
